

**Web Fig. 1 Membranous Glomerulonephritis:** PAS stained section of a glomerulus in membranous glomerulonephritis [MGN] showing thickened basement membranes with prominent spikes on silver methenamine stain [B] ( $\times 400x$ ); C: Electron micrograph showing electron dense deposits in the sub epithelial location of the basement membranes ( $\times 5300x$ ); D: IgG stained cryosection showing granular immune deposits in the basement membrane in case of MGN ( $\times 200x$ ); E : Deposits on subepithelial surface of basement membrane positive for PLA2R ( $\times 400x$ ). Diffuse Proliferative Glomerulonephritis (DPGN): F: HE stained glomerulus in DPGN showing endocapillary proliferation and infiltration by polymorphs [arrow] ( $\times 400x$ ); G: JSM Stained section showing segmental sclerosis in glomerulus ( $\times 400x$ )
